

Use Trends of Oil Pesticides: Cumulative Acres Treated

[Text files](#) of data are available. The reported cumulative acres treated that are oils. The oils category includes pesticides with a petroleum-based oil chemical (botanical oils are not included in these totals). Petroleum-based oils are often used as insecticides, fungicides, or adjuvants. Oils used as broad spectrum insecticides kill insects by either physically blocking their ability to breathe or affecting how they eat. Some refined petroleum-based oils are relatively lower risk than conventional pesticides and may be used in organic farming. Acres treated totals are cumulative, meaning that if a one-acre field was treated three times in a year, the cumulative acres treated would equal three acres. Cumulative acres treated totals include pesticide use reports (PURs) with unit treated equal to acres (A) or square feet (S), the latter of which was converted to acres. PURs with volume (cubic feet, etc.), weight (tons, lbs, etc.), or miscellaneous units (bins, holes, etc.) are not included in the acres treated totals. Most nonagricultural PURs are not required to report acres treated, so the acres treated totals are predominantly agricultural pesticide uses. If pounds were reported for a year but acres treated is zero, then the pesticide use was non-agricultural. The total for acres treated may be less than the sum of the table rows because the total is adjusted to prevent the overcounting of acreage for pesticide products with more than one active ingredient. Values greater than one are rounded. For more information, see Pesticide Use Annual Report Data Access, References, and Definitions [Guide](#).
