

2026 Pesticide Drinking Water Standards and Information

Table of Contents

Pesticide Drinking Water Standards 2

 This fact sheet contains information about drinking water standards for pesticides or degradates that the California Department of Pesticide Regulation’s (DPR) Groundwater Protection Program has sampled for or that had reported detections in DPR’s most recent Annual Well Sampling Report.

Pesticide Information 11

 This fact sheet contains chemical information, analytical methods, and major uses for pesticides or degradates that DPR’s Groundwater Protection Program has sampled for or that had reported detections in DPR’s most recent Annual Well Sampling Report.

PESTICIDE DRINKING WATER STANDARDS

Groundwater Protection Program Fact Sheet, Data Sources Checked July 2026

This fact sheet contains information about drinking water standards for pesticides or degradates that DPR’s Groundwater Protection Program has sampled for or that had reported detections in DPR’s most recent Annual Well Sampling Report. Each of the columns in the fact sheet table is described below. Agencies referenced in this fact sheet are DPR, the California State Water Resources Control Board (SWRCB), California Office of Environmental Health Hazard Assessment (OEHHA), United States Environmental Protection Agency (USEPA), and the United States Geological Survey (USGS). All values are reported in units of parts per billion (ppb), or about one drop of water in a swimming pool. Values that are not established are denoted as “—”. Data sources are noted by superscripts.

Pesticide: The name of the pesticide active ingredient or degradate. A degradate (metabolite) is a breakdown product formed when a pesticide active ingredient transforms through natural chemical or biological processes in the environment or within organisms.

HHRL [ppb] DPR¹: The Human Health Reference Levels (HHRLs) are identified by DPR's Human Health Assessment Branch. For some pesticides and degradates, HHA calculated acute and chronic HHRLs. This table includes the lowest HHRL of the two values. Residues measured in groundwater exceeding these reference levels indicate a health concern and should be sent to HHA for further evaluation.

MCL [ppb] SWRCB²: The Maximum Contaminant Level (MCL) is an enforceable, health protective drinking water level adopted by the state of California which considers not only a chemicals' health risks but also factors such as their detectability and treatability, as well as costs of treatment.

PHG [ppb] OEHHA²: Public Health Goals (PHGs), established by the state of California, are concentrations of drinking water contaminants that pose no significant health risk if consumed for a lifetime, based on current risk assessment principles, practices, and methods.

PHC [ppb] OEHHA³: Public Health Concentrations (PHCs), determined by the state of California, are concentrations of a chemical in drinking water that are not expected to pose a significant risk to health when consumed over a lifetime, and are developed using approaches and methods of OEHHA’s Public Health Goal Program. If differentiated, CE refers to a PHC derived for cancer effects and NCE refers to a PHC derived for non-cancer effects.

MCL [ppb] USEPA^{2, 4}: The Maximum Contaminant Level (MCL) is the highest level of a contaminant that is allowed in drinking water. MCLs are federally enforceable standards.

MCLG [ppb] USEPA^{2, 5}: The Maximum Contaminant Level Goal (MCLG) is a non-enforceable, federal health benchmark goal that is set at a level at which no known or anticipated adverse effect on the health of persons is expected to occur and which allows an adequate margin of safety.

Chronic or Lifetime HHBP [ppb] USEPA^{4, 6}: USEPA Chronic or Lifetime Human Health Benchmarks for Pesticides (HHBPs) are non-enforceable advisory values in drinking water protective of chronic non-carcinogenic effects over a lifetime of exposure, assuming that 20% of the exposure to a given pesticide is from water and additional exposure is derived from another source such as food, air, or dermal contact.

PESTICIDE DRINKING WATER STANDARDS

Groundwater Protection Program Fact Sheet, Data Sources Checked July 2026

Acute or One-Day HHBP [ppb] USEPA⁶: USEPA Acute or One-day Human Health Benchmarks for Pesticides (HHBPs) are non-enforceable advisory values in drinking water protective of acute or up to one-day non-carcinogenic effects, assuming that the entire exposure to a given pesticide is from drinking water.

Carcinogenic HHBP (10⁻⁶ to 10⁻⁴) [ppb] USEPA^{4, 6}: USEPA Carcinogenic Human Health Benchmarks for Pesticides (HHBPs) are non-enforceable advisory values protective of cancer effects. The HHBP range represents a one-in-one million (10⁻⁶) to one-in-ten thousand (10⁻⁴) cancer risk range.

One-Day HA [ppb] USEPA⁵: The One-Day Health Advisory (HA) is the concentration of a chemical in drinking water that is not expected to cause any adverse non-carcinogenic effects for up to one day of exposure (for a 10-kg child consuming 1 L of water/day).

Ten-Day HA [ppb] USEPA⁵: The Ten-Day Health Advisory (HA) concentration of a chemical in drinking water that is not expected to cause any adverse non-carcinogenic effects for up to ten days of exposure (for a 10-kg child consuming 1 L of water/day).

DWEL HA [ppb] USEPA⁵: A Drinking Water Equivalent Level (DWEL) is a lifetime exposure level, assuming 100% exposure from drinking water, at or below which adverse, non-carcinogenic health effects would not be expected to occur.

Lifetime HA [ppb] USEPA⁵: The Lifetime Health Advisory (HA) is the concentration in drinking water at or below which no adverse non-carcinogenic effects are expected for a lifetime of exposure (for a 70-kg adult drinking 2 L of water/day). The lifetime HA incorporates a drinking water risk concentration factor or a default of 20% of total exposure from all sources.

10⁻⁴ Cancer Risk [ppb] USEPA⁵: The concentration of a chemical in drinking water corresponding to an excess estimated lifetime cancer risk of 1 in 10,000.

Cancer Descriptor USEPA⁵: Chemicals evaluated under the USEPA 2005 Cancer Guidelines, or the 1996 or 1999 drafts, are denoted by their “Cancer Classification.” If the USEPA has not completed a new assessment for the chemical, the chemicals are denoted by the “Cancer Group.”

Cancer Classification: A descriptive weight-of-evidence judgment as to the likelihood that an agent is a human carcinogen and the conditions under which the carcinogenic effects may be expressed. Under the 2005 EPA Guidelines for Carcinogen Risk Assessment, Cancer Descriptors replace the earlier alpha numeric Cancer Group designations (US EPA 1986 guidelines). The Cancer Descriptors in the 2005 EPA Guidelines for Carcinogen Risk Assessment are as follows:

H - carcinogenic to humans

L - likely to be carcinogenic to humans

L/N - likely to be carcinogenic above a specified dose but not likely to be carcinogenic below that dose because a key event in tumor formation does not occur below that dose

S – suggestive evidence of carcinogenic potential

I – inadequate information to assess carcinogenic potential

N – not likely to be carcinogenic to humans

PESTICIDE DRINKING WATER STANDARDS

Groundwater Protection Program Fact Sheet, Data Sources Checked July 2026

Cancer Group: A qualitative weight-of-evidence judgment as to the likelihood that a chemical may be a carcinogen for humans. Each chemical was placed into one of the following five categories (US EPA 1986 guidelines):

- A - Human carcinogen
- B - Probable human carcinogen:
 - B1 - Indicates limited human evidence
 - B2 - Indicates sufficient evidence in animals and inadequate or no evidence in humans
- C - Possible human carcinogen
- D - Not classifiable as to human carcinogenicity
- E - Evidence of noncarcinogenicity for humans

Non-Cancer HBSL [ppb] USGS⁴: USGS Non-cancer Health-Based Screening Levels (HBSLs) are non-enforceable benchmarks of concentration protective of chronic non-cancer effects.

Cancer HBSL (10⁻⁶ to 10⁻⁴) [ppb] USGS⁴: USGS Cancer Health-Based Screening Levels (HBSLs) are non-enforceable benchmarks protective of cancer effects. The HBSL concentration range represents a one-in-one million (10⁻⁶) to one-in-ten thousand (10⁻⁴) cancer risk range.

PESTICIDE INFORMATION

Groundwater Protection Program Fact Sheet, Data Sources Checked July 2026

This fact sheet contains chemical information, analytical methods, and major uses for pesticides or degradates that DPR's Groundwater Protection Program has sampled for or that had reported detections in DPR's most recent Annual Well Sampling Report. Each of the columns in the fact sheet table are described below. Data sources are noted by superscripts.

Pesticide: The name of the pesticide or degradate.

Synonyms: Alternative names, abbreviations, or chemical formulas for the listed pesticide or degradate.

Type: Pesticides can be grouped by the type of pests affected. Herbicides are effective against plants. Insecticides are effective against insects. Fungicides are effective against fungi. Nematicides are effective against nematode worms. Degradates and their parents are noted in this column, if applicable.

DPR Chemical Code^{1, 2, 6}: The identification number assigned by DPR. There may be multiple identification numbers for each pesticide or degradate. The chemical codes can be used to look up pesticide data and product information.

DPR Analytical Method³: The number assigned to the analytical method used by DPR to analyze for the pesticide or degradate. A designation of (GW) means the analytical method was developed for groundwater samples. A designation of (SW) means the analytical method was developed for surface water samples. Surface water methods can be used for groundwater.

Primary Uses^{4, 5}: The primary uses of each pesticide in California. Degradates are not associated with use and are thus assigned "NA" for primary use. These data were obtained from the Pesticide Use Reporting (PUR) database and from the PAN Pesticide Database.
